FOLLOW-UP VISIT — MAXIMUM MEDICAL IMPROVEMENT

Date of service 06/12/2026 (Fri) · 8:45 AM · Established patient

PATIENT	DOB	MRN
DOE, JOHN	08/14/1991	LKO-218840
PRIOR VISITS	DATE OF INJURY	PAYER
03/05/2026 consult · 03/27/2026 follow-up	02/06/2026	Harbor Point MedPay HP-26-7741

Interval history

Underwent right-sided C6-C7 interlaminar cervical epidural steroid injection with Dr. Omar Haddad, Crescent Pain & Spine, on 05/15/2026, with roughly 60% improvement in arm symptoms beginning within a week. Discharged from Riverton Spine & Rehab on 06/05/2026 after 33 visits (plateau; independent home program). Therapy was interrupted from 04/02 to 04/21/2026 for lack of transportation, with a temporary setback, then resumed. Today: neck pain 2/10, worse after prolonged overhead work; **intermittent right-arm paresthesia** into the thumb and index finger about once a day, lasting minutes, and with sustained neck extension. Gabapentin at bedtime helps night symptoms. Working full shifts. No weakness, no dropping objects.

Examination

- Cervical rotation R 70° / L 76°; extension 45°, mild right arm tingling at end range. Mild right trapezius tenderness.
- Spurling's equivocal on the right. Light touch slightly diminished over the right thumb tip; otherwise intact.
- Strength 5/5 throughout, including right wrist extensors. Reflexes 2+ and symmetric (right brachioradialis improved from 1+). Hoffmann negative.

Assessment

C5-C6 right paracentral disc herniation with right C6 radiculopathy (M50.121), post-traumatic (motor vehicle collision 02/06/2026), improved with conservative care and one epidural steroid injection. Motor deficit resolved; residual intermittent right-arm paresthesia.

Maximum medical improvement: The patient has reached maximum medical improvement as of today, 06/12/2026. Further improvement with additional formal therapy is not expected.

Residuals: intermittent right-arm paresthesia (C6 distribution); activity-related neck pain.

Future medical care: Given the residual radicular symptoms, he may reasonably require **one to two repeat cervical epidural steroid injections within the next 24 months** for symptom recurrence, at an estimated **$3,400 each** (Crescent Pain & Spine's charge for the 05/15/2026 procedure). Continued home exercise program; gabapentin as needed. Surgical consultation only if progressive weakness develops.

Plan

1. Released from active orthopedic care. Full duty; self-limit sustained overhead work.
2. Gabapentin 300 mg, 1 cap PO at bedtime as needed for night paresthesia — refill sent to Riverton Drug (#60). Meloxicam may be stopped; OTC NSAID as needed.
3. Continue daily home exercise program from Riverton Spine & Rehab.
4. Return as needed for recurrence of arm symptoms, for repeat injection referral.
