Chief complaint

Neck pain and stiffness after a motor vehicle collision; numbness in the right hand.

History of present illness

34-year-old male, restrained front-seat passenger in a car struck on the passenger side at an intersection on 02/06/2026. Declined EMS transport at the scene. Reports onset at MVA 02/06/2026, progressively worsening; numbness to right hand since 02/18. Pain is posterior neck, right greater than left, radiating over the right trapezius and down the lateral right arm. Numbness involves the right thumb and index finger, intermittent, worse with looking up and turning the head to the right. Has been taking OTC ibuprofen and using lidocaine patches with partial relief. Missed work the week after the collision because of neck pain; worked 02/18 and 02/19. Denies loss of consciousness, headache at present, bowel or bladder change, gait change, or grip weakness. Pain 6/10 today, 8/10 at worst.

HISTORY		
PAST MEDICAL HISTORY None significant	PAST SURGICAL HISTORY None	ALLERGIES NKDA
CURRENT MEDICATIONS Ibuprofen OTC 400 mg PRN; lidocaine 4% patch PRN	SOCIAL Non-smoker · warehouse shift lead	PRIOR NECK INJURY Denies

132/84	82	16	98.4 °F	99% RA	6/10

Physical examination

- **General:** alert, oriented, in mild discomfort; holds neck stiffly.
- **Cervical spine:** tenderness and spasm of the right paraspinal and upper trapezius muscles; no midline bony tenderness, no step-off. Active ROM reduced and painful: rotation R 40° / L 55°, extension 30°, flexion 40°.
- **Neuro:** decreased light-touch sensation over the right thumb and index finger. Strength 5/5 bilateral upper extremities except right wrist extension 5-/5. Reflexes 2+ and symmetric; biceps and brachioradialis R 2+. Hoffmann negative.

- **Shoulders:** full ROM, no focal tenderness. **Skin:** no bruising or abrasion at present.

Imaging: none today (no midline tenderness, no red flags; NEXUS criteria applied).

Assessment

ICD-10	Diagnosis
S16.1XXA	Strain of muscle, fascia and tendon at neck level, initial encounter (cervical strain)
R20.2	Paresthesia of skin, right hand — rule out cervical radiculopathy (M54.12)
V43.63XA	Car passenger injured in collision with pickup truck in traffic accident, initial encounter

Plan

1. **Rx:** cyclobenzaprine 10 mg, 1 tab PO at bedtime PRN spasm, #30, no refills (may cause drowsiness — no driving). Naproxen 500 mg, 1 tab PO twice daily with food, #60, no refills. Stop OTC ibuprofen while taking naproxen.
2. **Referral:** orthopedics for evaluation of radicular symptoms (patient given list; Lakeside Orthopedics, 2 Lakeside Dr).
3. Recommend chiropractic care and/or physical therapy for cervical strain; home heat and gentle ROM.
4. Return or go to the ED for progressive weakness, spreading numbness, loss of bowel or bladder control, or severe headache.
5. Work note provided: may work; avoid lifting over 25 lb and overhead work for 2 weeks.
